**From Donna M Paulnock : Macrophages: A Practical Approach (Practical Approach Series)** before purchasing it in order to gage whether or not it would be worth my time, and all praised Macrophages: A Practical Approach (Practical Approach Series):

Macrophages are an important part of the immune response and are characterized by their ability to phagocytose foreign matter. However the difficulties involved in macrophage isolation mean they are some of the body's least explored cells. Macrophage Methodology describes how to isolate moderate to high yields of viable cells from a variety of specific tissue sites under both normal and pathological conditions and then goes on to give protocols for macrophage purification. The third chapter covers techniques used to identify and measure endocytic and phagocytic capabilities using immunochemistry and fluorescent analysis. Chapter four identifies the key issues relating to the

study of macrophages as antigen presenting cells and has protocols for the major assays used to measure antigen processing and presentation. Also covered are the theoretical and practical issues related to the processing and presentation of intracellular pathogens for which macrophages are the major host cell. The methods described for measuring macrophage secretory products concentrate on bioassays for molecules where no ELISA is available. The next two chapters cover measuring macrophage activity in vitro and in vivo. Finally methods are described for the analysis of gene expression in macrophages. A variety of broad techniques have been brought together in one affordable volume to make *Macrophage Methodology* an essential buy for anyone studying macrophages.

About the Author Donna M. Paulnock is at University of Wisconsin Medical School.
